

Countywide Feasibility Study:

We are looking for funding to conduct a feasibility study that looks at multiple locations throughout the county to site a biomass facility. The study will examine the environmental, economic, and social “limiting factors” at each site. Communities near each location will give input into biomass technologies that could be located near them. Our group will then seek out investors to develop a biomass facility that fits within these parameters. The map below shows possible locations that will be analyzed in the feasibility study. Based on information collected in the feasibility study the WBWG will create a “Feasibility Matrix” that show the appropriate scale and biomass technology that could be located at each site based on the 3-E limiting factors. The chart below is an example of what this feasibility matrix may look like.
